Lecture 8
Software Pipelining

I. Example of DoAll Loops

- **Machine:**
  - Per clock: 1 read, 1 write, 1 (2-stage) arithmetic op, with hardware loop op and auto-incrementing addressing mode.

- **Source code:**
  For \( i = 1 \) to \( n \)
  \[
  D[i] = A[i] \times B[i] + c
  \]

- **Code for one iteration:**
  1. LD R5,0(R1++)
  2. LD R6,0(R2++)
  3. MUL R7,R5,R6
  4. 
  5. ADD R8,R7,R4
  6. 
  7. ST 0(R3++),R8

- **No parallelism in basic block**
Unrolling

1. LD
2. LD
3. MUL LD
4. MUL LD
5. ADD LD
6. ADD LD
7. ADD LD
8. ST MUL LD
9. ST ADD
10. ST ADD
11. ST
12. ST
13. ST BL (L)

- Let \( u \) be the degree of unrolling:
  - Length of \( u \) iterations = \( 7 + 2(u-1) \)
  - Execution time per source iteration = \( \frac{7 + 2(u-1)}{u} = 2 + \frac{5}{u} \)

Software Pipelined Code

1. LD
2. LD
3. MUL LD
4. MUL LD
5. ADD LD
6. ADD LD
7. ADD LD
8. ST ADD LD
9. ST ADD LD
10. ST ADD MUL
11. ST ADD
12. ST
13. ST
14. ST
15. ST
16. ST

- Unlike unrolling, software pipelining can give optimal result.
- Locally compacted code may not be globally optimal
- DOALL: Can fill arbitrarily long pipelines with infinitely many iterations
Example of DoAcross Loop

Loop:
Sum = Sum + A[i];
B[i] = A[i] * c;

Software Pipelined Code
1. LD
2. MUL
3. ADD
4. ST

Doacross loops
• Recurrences can be parallelized
• Harder to fully utilize hardware with large degrees of parallelism

Problem Formulation

Goals:
– maximize throughput
– small code size

Find:
– an identical relative schedule $S(n)$ for every iteration
– a constant initiation interval ($T$)
such that
– the initiation interval is minimized

Complexity:
– NP-complete in general
II. Resources on Bound on Initiation Interval

- Example: Resource usage of 1 iteration;
  Machine can execute 1 LD, 1 ST, 2 ALU per clock

  LD, LD, MUL, ADD, ST

- Lower bound on initiation interval?

  for all resource \( i \),
  number of units required by one iteration: \( n_i \)
  number of units in system: \( R_i \)

  Lower bound due to resource constraints: \( \max \frac{n_i}{R_i} \)

Scheduling Constraints: Resource

- \( RT \): resource reservation table for single iteration
- \( RT_s \): modulo resource reservation table

\[ RT_s[i] = \sum_{t \mod T = i} RT[t] \]
Algorithm for Acyclic Graphs

Find lower bound of initiation interval: $T_0$

Based on resource constraints

For $T = T_0$, $T_0+1$, ... until all nodes are scheduled

For each node $n$ in topological order

$s_0 = \text{earliest } n \text{ can be scheduled}$

For each $s = s_0$, $s_0+1$, ..., $s_0+T-1$

if NodeScheduled($n$, $s$) break;

if $n$ cannot be scheduled break;

NodeScheduled($n$, $s$)

– Check resources of $n$ at $s$ in modulo resource reservation table

• Can always meet the lower bound if

  – every operation uses only 1 resource, and

  – no cyclic dependences in the loop
III. Scheduling Constraints: Precedence

for (i = 0; i < n; i++) {
    *(p++) = *(q++) + c
}

- Minimum initiation interval?
- \(S(n)\): Schedule for \(n\) with respect to the beginning of the schedule
- Label edges with \(<\delta, d>\)
  - \(\delta\) = iteration difference, \(d\) = delay
  \[\delta \times T + S(n_2) - S(n_1) \geq d\]

Scheduling Constraints: Precedence

for (i = 2; i < n; i++) {
}

- Minimum initiation interval?
- \(S(n)\): Schedule for \(n\) with respect to the beginning of the schedule
- Label edges with \(<\delta, d>\)
  - \(\delta\) = iteration difference, \(d\) = delay
  \[\delta \times T + S(n_2) - S(n_1) \geq d\]
Minimum Initiation Interval

For all cycles $c$,

$$\max_c \frac{\text{CycleLength}(c)}{\text{IterationDifference}(c)}$$
Strongly Connected Components

- A strongly connected component (SCC)
  - Set of nodes such that every node can reach every other node
- Every node constrains all others from above and below
  - Finds longest paths between every pair of nodes
  - As each node scheduled, find lower and upper bounds of all other nodes in SCC
- SCCs are hard to schedule
  - Critical cycle: no slack
    - Backtrack starting with the first node in SCC
      - Increases $T$, increases slack
- Edges between SCCs are acyclic
  - Acyclic graph: every node is a separate SCC

Algorithm Design

Find lower bound of initiation interval: $T_0$
- Based on resource constraints and precedence constraints
For $T = T_0$, $T_0+1$, ..., until all nodes are scheduled
  - $E^*$ = longest path between each pair
  - For each SCC $c$ in topological order
    - $s_0 = \text{Earliest } c \text{ can be scheduled}
    - For each $s = s_0, s_0 + 1, ..., s_0 + T - 1$
      - If SCCScheduled($c, s$) break;
      - If $c$ cannot be scheduled return false;
  - Return true;
Scheduling a Strongly Connected Component (SCC)

**SCCScheduled**(c, s)
 Schedule first node at s, return false if fails
For each remaining node n in c
    sₙ = lower bound on n based on Eᵢₙ
    sᵤₙ = upper bound on n based on Eᵢₙ
    For each s = sₙ, sₙ+1, min (sₙ+T-1, sᵤₙ)
        if **NodeScheduled**(n, s) break;
        if n cannot be scheduled return false;
Return true;

IV. Register Allocation

• Software-pipelined code

1. LD
2. LD
3. MUL LD
4. LD
5. MUL LD
6. ADD LD
7. MUL LD
8. ST ADD LD BL L
9. MUL
10. ST ADD
11. ST ADD
12. ST
13. ST
14. ST

1. LD R5, 0(R1++)
2. LD R6, 0(R2++)
3. MUL R7, R5, R6
4. ADD R8, R7, R4
5. ADD R8, R7, R4
6. ADD R8, R7, R4
7. ST 0(R3++), R8
## Modulo Variable Expansion

1. LD R5,0(R1++)
2. LD R6,0(R1++)
3. LD R5,0(R1++) MUL R7,R5,R6
4. LD R6,0(R1++)
5. LD R5,0(R1++) MUL R17,R5,R6
6. LD R6,0(R1++) ADD R8,R7,R7

### Algorithm

- **Normally, every iteration uses the same set of registers**
  - introduces **artificial anti-dependences** for software pipelining
- **Modulo variable expansion algorithm**
  - schedule each iteration ignoring artificial constraints on registers
  - calculate life times of registers
  - degree of unrolling = max. (lifetime, T)
  - unroll the steady state of software pipelined loop to use different registers
- **Code generation**
  - generate one pipelined loop with only one exit
    (at beginning of steady state)
  - generate one unpipelined loop to handle the rest
  - code generation is the messiest part of the algorithm!
Conclusions

- **Numerical Code**
  - Software pipelining is useful for machines with a lot of pipelining and instruction level parallelism
  - Compact code
  - **Limits to parallelism**: dependences, critical resource
